

ABSTRACT OF THE DISCLOSURE

A centrifugal, rotating power element and a massaging device using the same, which is characterized in that the driving shaft is provided with a swinging member having a root section and an end section and the weight of the root section and that of the end section are of certain ratio, and the root section and the end section are connected flexibly such that when the driving shaft rotates, the end portion of the swinging element is provided with an appropriate torsional swinging force as a result of the centrifugal force. The massaging device employs the power element comprising a mask body having a front and a rear plate, a securing plate being mounted to the mask body for mounting a securing seat and the power element, and a plurality of securing seat mounted at the mask body for mounting a plurality of the power elements and two binding straps mounted at the two lateral sides of the rear plate of the mask body; and a controller having one end connected to a conductive wire and the mask body.
